a **Single structures: section r1 against r2**

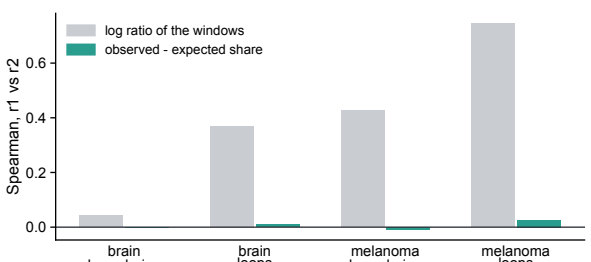

excess smooth share of each structure's per-spot score (over shuffled spots), after depth, RNA and copy number; human melanoma

boundaries: chromosome X in rose (haploid: half the contacts); loops: colour = span (yellow: short, 5-95 % of the spans)

b **Agreement between the sections**

Spearman correlation of the structures' excess, r1 vs r2, after depth + RNA + copy number

c **Pooled over all structures**

a spot's insulation and loop strength against its expected: smooth share vs shuffled spots
